

Vegetable Planting Guide and Recommended Planting Dates

Allen Straw, Extension Horticulturist, Southwest Virginia Agricultural Research and Extension Center

When to Plant

The Planting Area Map can be used to determine the average date of last killing frost in your area. Actual dates will vary due to local conditions and yearly temperature fluctuations. You can use the average date of the last killing frost in the spring to adapt the Recommended Planting Dates Chart to your particular area.

How Much to Plant

The Vegetable Planting Guide can be used to determine the approximate amount of crop to plant for the desired yield, the amount of seed or number of transplants required for that amount of crop, and proper spacing between plants in a row. In intensive, raised-bed gardens, use the in-row figures between all plants; i.e., use equidistant spacing between plants. Sow seeds to a depth three to five times the diameter of the seed. For mid-summer plantings, dry soils may require you to sow up to twice this depth.
